

Generator ↔ Motor

Assessment

How reliably can you generate electricity?

How accurate is the construction of your device?

How easily does your device generate electricity? How could you improve that?

How sturdy is your device? Does it stand up to repeated use without breaking?

What is a force that opposes motion between two surfaces?

Generator ↔ Motor

What is the difference between mass and weight?

What slows down the motion of an object or keeps it starting?

What is electricity and where does it come from?

Can you find electricity in nature? If so, where and for what purpose is it?
